

Healthy Lawns, Healthy Environment!

We are proud to offer a turf grass fertilization program using Milorganite - a locally produced, organic fertilizer. The slow-release nitrogen in Milorganite guarantees that grass plants have a consistent nutrient supply for healthy growth, while preventing nutrient run-off into our gutters, lakes, and streams. Milorganite can also be applied without burning even in the driest weather, and the organic matter in Milorganite actually improves soils to strengthen your lawn. Using Milorganite promotes a thick, healthy, green turf, able to resist weed pressure. Milorganite is non-toxic to children and pets, and contains no harmful salts or pesticides.

We believe that a healthy lawn should also be healthy for our water and soils, our homes and our customers!

Seasonal Turf Care Fertilization Program

- Early Spring (April)** Starter application for quick greening and spring growth.
- Late Spring (May/June)** Application supports rapid growth and prepares grass for hot and dry summer conditions.
- Summer (July/August)** Application for growth and good color. Non-burning nitrogen in Milorganite means fertilizer can be applied even to summer-dormant grass so it is available as soon as growth resumes.
- Fall (September)**
Application supports rapid growth and good color during fall rains.
- Winterizer (after last mowing – October/November)**
Non-leaching phosphorus in Milorganite (exempt from WI phosphorus ban) strengthens grass roots for the winter season.
